Boat House Lift

IMM Quality Boat Lifts has many solutions for your boat house lift needs. Our boathouse lifts can be built to be a structural part of your boathouse by using custom stringer brackets welded to the top of a beamed boat lift to support the outer support bands of the roofing system.

We can retrofit your existing boathouse using custom welded side mounting brackets. Boathouse lifts hanger bearings are the most common and effective way to mount a boat house lift inside a new or existing structure. The bearings are fastened to the hanger assembly, which then slides over the stringer bands of the boathouse. Once in place, the brackets are fastened to the bands using stainless steel bolts and require no drilling of the bands. Suspension brackets allow you to hang a standard 4-pile lift in various positions along overhead support beams and give full adjustability in all directions.

FEATURES AND OPTIONS

Boat House Lift Standard Features

A Side mount brackets are used for mounting standard top beam lifts to piling when the top of piles are not accessible or other mounting means are not available.

B Stringer brackets are mounted to the top of the lift beam and are used to support the roofing system.

Our lift hanger brackets make for the most versatile boat house lifts in the industry. With our system, your lift installation is not dictated by piling layout.

Our hanger brackets easily allow fore - aft adjustment of the lift position to best suit your boat. Maximizes slip usage (width). Our hanger brackets allow for an out of sight installation.

Coupled with our no-maintenance platinum drive, our boat house lift is truly unobtrusive and worry free.

Suspension brackets allow a standard top beam design lift to hang from boat house structural cross beams.

Great for retrofits into existing boat houses. Repair / replacement does not require alteration of boat house structure. An economical choice that saves money using less aluminum by eliminating the top beam.

Allows for the installation of traditional top beam design lifts onto boat house structural cross beams that run perpendicular to the slip.
